MORNING WARD ROUND NOTES — CYCLE 3 ASSESSMENTS

Date: 08 October 2024 | Attending: Dr. Yemi Adeyemi, Sub-Investigator | CRC: Nurse Lisa Huang

All patients seen between 07:30 and 11:15. Notes dictated and typed by Dr. Adeyemi.

SUBJECT 1

We started rounds with patient number SUB-004, a thirty-two-year-old female on Cycle 3 Day 1. She came in looking well today, much improved from last cycle. Blood pressure was recorded at one hundred and twenty-eight over eighty-four millimetres of mercury. Heart rate was seventy-six beats per minute and regular. Temperature thirty-seven point one degrees Celsius. Weight today is sixty-three point four kilograms, which is stable compared with sixty-three point eight kilograms at Cycle 2 Day 1. She reports mild headache over the past three days, she rates it a two out of ten and says it is not limiting her activities. No nausea this cycle, no vomiting. She is taking her study medication every morning with breakfast. No missed doses per diary review. Respiratory rate fourteen per minute. Oxygen saturation ninety-eight percent on room air.

She mentioned she has been feeling mild fatigue, approximately three out of ten, but is still working full time as a nurse. No rash, no diarrhoea, no abdominal pain. Joint pains from her prior history of mild osteoarthritis unchanged. We reviewed her labs from the central laboratory faxed overnight: haemoglobin eleven point two grams per decilitre, white cell count four point eight times ten to the nine per litre, platelets two hundred and twelve times ten to the nine, ALT thirty-one units per litre, creatinine point eight milligrams per decilitre, all within acceptable ranges.

SUBJECT 2

Next we saw patient SUB-009, forty-five-year-old male, currently on Cycle 3 Day 15. He came in with his wife today and seemed anxious. Blood pressure was elevated at one hundred and fifty-eight over ninety-six compared to his usual baseline of around one thirty over eighty. Heart rate was ninety-two beats per minute. Temperature thirty-six point eight degrees Celsius. Weight sixty-one point two kilograms, a slight decrease from sixty-two point five at last visit. He is complaining of significant fatigue rated seven out of ten, muscle aches predominantly in the thighs and calves, and decreased appetite. He says he has not been eating properly for about ten days. He is taking his medication but sometimes takes it in the evening instead of the morning when he forgets. Respiratory rate sixteen, oxygen saturation ninety-six percent on air.

His wife mentioned he has been 'yellow around the eyes' intermittently over the past week but it was not present this morning on examination. We will await this morning's laboratory results before making a management decision. He denies fever, chest pain, shortness of breath. No skin rash. Bowel movements normal. Urine described as darker than usual, 'like apple juice colour' for the past four days.

SUBJECT 3

We then reviewed patient SUB-014, a fifty-eight-year-old female, Cycle 3 Day 1. This patient was seen by the research nurse only as Dr. Adeyemi was called to answer a page. According to nurse notes, blood pressure one twelve over seventy, heart rate eighty-two, temperature thirty-eight point one degrees Celsius, which is low-grade

fever territory. Weight fifty-six point eight kilograms, down from fifty-nine point three kilograms at Cycle 2 Day 1, representing a loss of two point five kilograms in twenty-eight days. She reports ongoing diarrhoea, four to five loose stools per day for the past two weeks. She is also reporting intermittent right upper quadrant abdominal discomfort. No vomiting. She took all study medication doses without missing any. She says she has been feeling cold and shivery at night but has not measured her temperature at home.

SUBJECT 4

Fourth patient this morning was SUB-022, a sixty-one-year-old male seen for Cycle 3 Day 1. He presented independently, drove himself to the clinic. He is a retired teacher and very engaged with the trial. Blood pressure one thirty-four over eighty-two, heart rate sixty-eight, temperature thirty-six point six, respiratory rate fourteen. Weight seventy-nine point four kilograms, stable from seventy-nine point one last cycle. He reports feeling well overall, no nausea, no vomiting, no diarrhoea. Mild tingling in the fingertips bilaterally for the past two weeks which is new and which he describes as 'like pins and needles when you sit on your leg.' He rates it three out of ten in severity. No frank pain. No gait difficulty. He is taking his medication faithfully every morning. He asks whether the tingling might be from the drug and we discussed that peripheral sensory symptoms can occur. Otherwise no complaints. Oxygen saturation ninety-nine percent.

SUBJECT 5

The final patient seen this morning was SUB-031, a seventy-three-year-old male, Cycle 3 Day 1. This patient was recently discharged from inpatient admission (19 September 2024) following Grade 4 drug-induced liver injury. Study drug has been permanently discontinued for this subject. He was attending today for a post-hospitalisation safety follow-up visit only, not a per-protocol treatment visit. Blood pressure one eighteen over seventy-four, heart rate eighty, temperature thirty-six point nine. Weight sixty-eight point eight kilograms, up from sixty-six point one at discharge, reflecting fluid repletion and nutritional recovery. He appears clinically improved. He remains jaundiced clinically, icteric sclerae still visible. He reports ongoing fatigue rated five out of ten but says appetite is returning gradually. Repeat liver function tests pending from today's blood draw.

Ward round concluded at approximately 11:15. All findings communicated to Principal Investigator Dr. Marcus Webb by telephone at 11:30. CRC to enter all data into the EDC system by end of day.
