

# ZENITH-001 PHASE II CLINICAL TRIAL

## SITE MONITORING VISIT — CLINICAL NARRATIVE REPORT

**Site: Harborview Cancer Research Institute — Site 003**

Report Date: 31 August 2024 | Week 8 Assessments | CRA: Ms. Priya Nambiar

---

### OVERVIEW OF SITE VISIT

This narrative report summarises the clinical observations made by the Contract Research Organisation (CRO) Clinical Research Associate during the Week 8 monitoring visit to Harborview Cancer Research Institute. A total of six study subjects were assessed during this visit, all of whom had completed their Cycle 2 Day 1 visits within the prior five business days. Subject-level narratives are provided below based on review of source documents and EDC data.

### SUBJECT NARRATIVES — WEEK 8 ASSESSMENTS

Subject SUB-002, a forty-nine-year-old male enrolled in June and now at Week Eight. His treating physician noted in the source document that his systolic blood pressure has been trending downward over the past two cycles. At Cycle One Day One his pressure was one forty-six over ninety. At Cycle One Day Fifteen it dropped to one thirty-two over eighty-six. Today at Cycle Two Day One it is recorded as one nineteen over seventy-four. His heart rate at today's visit was recorded as eighty-one beats per minute. Body temperature was thirty-six point five degrees. He weighed in at eighty-two point three kilograms compared to eighty-four point one at his last visit. He is reporting mild fatigue, grade one by investigator assessment, and intermittent loose stools once or twice a day. No vomiting. No rash noted on physical examination. His ECOG performance status is zero.

Moving on to Subject SUB-007, a sixty-seven-year-old female. The visit note from the investigator describes her as 'doing reasonably well despite feeling tired.' She weighed sixty-one point seven kilograms today. Her vital signs showed a blood pressure of one hundred and ten over sixty-eight, heart rate of eighty-eight, and temperature of thirty-seven point three. She reports difficulty sleeping over the past three weeks, which she attributes to anxiety about her illness rather than to the study medication. She is also experiencing grade two nausea which has been partially controlled with ondansetron. She vomited once yesterday in the morning. The investigator noted in the margin of the source document that her haemoglobin came back at nine point four grams per decilitre from the central lab, flagged as grade two anaemia. Her previous haemoglobin was ten point eight at cycle one.

Subject SUB-011 is a fifty-three-year-old male. Today's weight is ninety-one point two kilograms. His blood pressure was recorded by the research nurse as one thirty-eight over eighty-eight and then re-measured ten minutes later by the physician as one thirty-one over eighty-two. Heart rate sixty-four. Temperature thirty-six point eight. He is asymptomatic with no complaints at this visit. Performance status zero. His only reported change from last visit is that he started taking melatonin five milligrams at night for sleep, purchased over the counter. He did not report this to the study team until the CRA specifically asked about supplement use during the review.

Subject SUB-016 is a forty-four-year-old female. She was accompanied by her daughter who served as interpreter as the patient speaks limited English. Weight was recorded as fifty-four point nine kilograms. Vital signs: blood pressure one twenty-two over seventy-eight, heart rate seventy-one, temperature thirty-seven point zero. She

reports via the interpreter that she has been experiencing mild burning pain in the palms of both hands and the soles of her feet over the past ten to fourteen days. The investigator describes this as possible palmar-plantar dysesthesia and grades it as grade one. No skin peeling or blistering noted. She denies nausea or vomiting this cycle but says she has no appetite and has been eating approximately half of her usual meals.

Subject SUB-019, a seventy-one-year-old male. He arrived forty-five minutes late for his visit due to transportation issues. His blood pressure was one fifty-two over ninety-four on arrival, which the investigator attributed to stress and exertion from rushing. A repeat measurement thirty minutes later after the patient rested showed one thirty-eight over eighty-six. Heart rate dropped from ninety-eight on arrival to eighty-one after rest. Temperature thirty-six point seven. Weight seventy-four point six kilograms compared to seventy-six point two at baseline, representing a loss of one point six kilograms over eight weeks. He is reporting moderate constipation over the past two weeks, going three to four days between bowel movements, which is new for him. He rates abdominal discomfort from constipation at four out of ten. He is taking docusate sodium purchased from a pharmacy without informing the site.

The final subject seen was SUB-025, a thirty-eight-year-old female, which is the youngest subject enrolled at this site. Weight forty-nine point eight kilograms, the lowest weight on record for her across all visits. Her previous weight at Cycle One Day One was fifty-two point two kilograms and at Cycle One Day Fifteen fifty-one point one kilograms. Today she is forty-nine point eight kilograms, a total loss of two point four kilograms from baseline over eight weeks. Blood pressure one hundred and eight over sixty-six. Heart rate ninety-four. Temperature thirty-seven point six, borderline low-grade fever. She is experiencing grade two nausea, grade one vomiting, and reports significant loss of appetite. She is struggling to drink enough fluids. Peripheral examination shows mild pallor. The investigator has recommended IV fluid top-up at the next available appointment.

End of Narrative Report. All observations have been entered into the CRO monitoring log and communicated to the site Principal Investigator Dr. Helena Osei-Bonsu on 31 August 2024. Outstanding data queries raised: three queries filed for SUB-007 (anaemia grading), SUB-019 (unreported concomitant medication), and SUB-025 (weight change documentation).
